

# ENLIGHTENMENT ACTIVITY

The Institute is actively involved in scientific and enlightenment activities. Every year, on the occasion of World Cancer Day, actions are initiated to inform the general population about the causes of cancer and its prevention.

Since February 2010, a social and enlightenment project for senior schoolchildren and students "Lectures of oncologists on the protection of the health of young people in Ukraine" was founded and successfully operates. The project goal is to promote the development of motivational components in children's attitudes towards their health, encouragement to a healthy lifestyle by raising awareness of cancer and the effectiveness of primary cancer prevention measures. Lectures are prepared and presented by young scientists in coordination with the scientific and information sector of the Institute.

Within the framework of the Festivals and Days of Science for schoolchildren and students, our young scientists regularly organize excursions to the laboratories and departments of the Institute, give popular science lectures, conduct quizzes and quests, in which, playfully, they retell students about modern achievements in the field of biomedical sciences and the latest research methods, which is an important basis for attracting young people to scientific activities.
